

# MARKETING EFFICIENCY: A CASE STUDY OF MAIDUGURI CATTLE MARKET, BORNO STATE, NIGERIA.

Y. BILA and Y. BULAMA

(Received 26 August, 2004; Revision Accepted 8 November, 2006)

## ABSTRACT

The study aimed at determining the efficiency of the marketing system of Maiduguri cattle market, by measuring performance of the market. The study made use of primary data, which were collected from questionnaires randomly administered to the buyers, sellers. Performance was measured in terms of price analysis, marketing margins, cost and returns analysis, marketing efficiency. The analysis of the results showed marketing margin is low (47.84%) marketing efficiency was appreciable (42.29%) while pricing was inefficient (-336.54%) and net returns per head was N1,698.76. This concludes that the market is a fairly efficient market with an inefficient pricing system

## INTRODUCTION

The overall aim of marketing efficiency is to provide goods to consumer in the required form at the required time and place with the lowest possible marketing costs, consistent with interests of the producers. Farmers define efficiency as the sale of their products at the highest possible price while consumers see efficiency as the provision of high quality supplies at the lowest possible price. High price would therefore, limit sales to consumers, and low prices would discourage the production of future supplies. The satisfaction of cost is linked with the maintenance of a high volume of farm output.

The major indicators of efficiency are marketing margin, consumer prices, market competition and availability of physical marketing facilities. A marketing efficiency is more likely to be high in a competitive market than in a less competitive one. It is expected that in an inefficient market prevailing prices reflect costs plus a normal profit margin while quality of services provided in relation to cost and consumer desires should neither be too high nor too low. However, prevailing high prices in urban retailer marketing in Nigeria and low prices at the farm gate level result from poor marketing infrastructure and services.

The major aim of marketing system is to achieve efficiency. But most of the agricultural markets in Nigeria are inefficient due to high margins, abnormal profits, poor infrastructural facilities, high marketing cost and poor price performance (Ditto, 1994, Adeyeye, 1986, Hays & McCoy, 1978). Improvements need to be done in order to improve efficiency of the markets. The Maiduguri livestock market is one of the largest in the country and it serves as a producing as well as transit market for livestock especially of cattle (Balami et al., 1999). Though some research have been conducted concerning of trading of cattle in the marketing, only few involved performance of the market in particular, therefore the need for this study.

## Objectives of the study

The study aimed at determining the efficiency of main cattle market in Maiduguri. Specifically, the study sought to assess market performance by use of price analysis, market margin analysis, marketing costs and returns and marketing efficiency.

## METHODOLOGY

### Study area

Maiduguri the capital of Borno State is located in the North Eastern corner of Nigeria. It has 3 three main districts, Yerwa, Bolori and Gwage, and 15 wards. The climate is hot

and dry for a greater part of the year with a short rainfall period of three month, from June to September. The sahel vegetation consist of mainly Neem trees and a few shrubs. The major occupation of the people is farming. Crops grown include groundnut, cowpea, millet, maize and guinea corn while animals reared are cattle, sheep, goat and poultry. The main livestock market, kasuwan Shanu, at Gomboru Ward serves as producing, trading as well as transit center for livestock especially cattle.

### Data collection

Primary data were collected from questionnaires administered to 43 respondents out of about 200 participants in the market. The questionnaires were administered to 14 wholesalers, 24 retailers (6 fatteners, 18 ordinary retailers), 4 market staff / workers and 1 butcher.

### Data analysis

Market performance was measured based on findings on marketing margin, costs and returns, marketing and price efficiencies.

### Marketing margin, costs and returns

#### a. Marketing Margin:

According to Abbott and Makeham (1979) marketing margin is the difference between the purchase price and the price received on resale. It shows the fraction of the consumer's expenditure on a commodity that is received by the producer or the marketing agents. The general formula for calculating marketing margin, according to Olukosi and Isitor (1990) is written as -

$$MM = \frac{CP - SP}{CP} \times 100$$

Where MM = Marketing Margin

CP = Consumer price

SP = Seller's price

Marketing margins may fluctuate depending on perishability of products, the number of level of participants in the marketing channel, the marketing services provided and risk and uncertainty borne by each of the market participants (Pomeroy and Trinidad, 1995, Digby, 1997). The value of marketing margin obtained would indicate the percentage share that the producer received from the consumer.

#### b. Marketing Costs and Returns

##### i. Marketing Costs

Marketing costs are the actual expenses incurred in the performance of the marketing functions as a commodity

Y. Bila, Department of Agricultural Economics and Extension, University of Maiduguri, Nigeria.

Y. Bulama, Department of Agricultural Economics and Extension, University of Maiduguri, Nigeria.

moves from the farm to the ultimate consumers (Olukosi and Isitor, 1990) Marketing costs consist of fixed and variable costs

The fixed costs include capital invested, costs of sheds, ropes, food containers, water containers and bamboo sticks for tether. The variable costs are: transportation cost, cost of labour (L), cost of handling (H), tax per animal head (HT), space/shed rent (RT), costs of feeding and vaccines (V), gate fee/head, state revenue per head, costs of agent fee, dealer license fee, annual agent/seller tax, and cost of loss due to diseases or price decline. Addition of variable costs items and fixed costs items is expected to give total cost

#### ii. Market Returns (Net Returns)

The net returns is the difference between what is received and costs incurred. This according to (Pomeroy and Trinidad, 1995) is mathematically presented as

$$NR = \sum P_i V_i - (F_c + V_c)$$

Where: NR = Net Returns  
 $P_i$  = Average price of cattle handled per week  
 $V_i$  = Number of cattle handled per week  
 $F_c$  = Fixed Costs  
 $V_c$  = Variable Costs

If NR gives a positive figure, the market would be expected to be efficient.

#### c. Marketing Efficiency

Marketing efficiency is defined as the maximization of the ratio of output to input in marketing (Olukosi and Isitor, 1990) It is expressed as:

$$ME = \frac{\text{Value added by marketing}}{\text{Cost of marketing services}} \times 100$$

For the market to be efficient, marketing efficiencies must be at least equal to or close to average (that is, 50%) percentage.

#### d. Pricing Efficiency

Pricing efficiency refers to the improvement of the operations of buying and selling and pricing output to reflect consumer's wish (Abbott and Makeham, 1979).

Pricing efficiency was determined using efficiency ratio, which measures the benefits to costs for a particular marketing system or commodity (Olukosi and isitor 1990) It is expressed as

$$ER = 100 - \frac{(C_1 + C_2)}{V} \times 100$$

Where ER = Efficiency Ratio  
 $C_1$  = Total costs of purchase  
 $C_2$  = Total Costs of marketing  
 $V$  = Total Value of cattle marketed

The market would be expected to be efficient if ER is positive

## RESULT AND DISCUSSION

### a. Marketing margin

The total gross marketing margin for the whole marketing system is 47.84%. This margin (below average of 50%) indicates an average return on the cost of providing marketing services. It also indicate that the producers share is appreciable.

The respective marketing margins for the various seller categories are 15% for ordinary retailers, 77.2% for cattle fattener, 47.6% for wholesaler and 6% for the butcher (Table 2). Wholesaler, retailers and the butcher have normal and acceptable margins (below average of 50%) Fatteners have a very high margin which means they receive a greater share from what the consumer pays than the producer. The fattener's high margin could be due to additional costs involved in feeding few animals for the whole fattening period and the eventual resale price obtained due to animals' large sizes. The butcher had the least, he buys and sells the carcass as meat to consumer. His marketing costs is minimal, only cost of slaughter, skinning and butchering. The slight difference (24) between the total gross marketing margin (47.84% and wholesalers margin (47.6%) suggests that wholesalers handle higher percentage of sales in the market than retailers and fatteners.

Table 1: Fixed and Variable Costs for Wholesalers in Maiduguri Cattle Market 2003

| S/No.        | Variable                   |                |                          |                         | Fixed Cost                                       |                         |   |
|--------------|----------------------------|----------------|--------------------------|-------------------------|--|-------------------------|---|
| S/No.        | No. of cattle handled week | Tax head       | Labour/truck (transport) | Cost of transport truck | Toll gate fee and revenue for other states/truck | Dealer license fee/year | Capital costs = average purchase price x No. of cattle handled/week |

**Marketing costs and returns**

**a. Marketing costs**

The marketing costs include both fixed and variable costs. All respondents could not disclose their capital

investments, therefore, purchase price of cattle was used as fixed (capital) costs. Retailers have additional fixed costs apart from capital costs (Table 3)

Table 2: Marketing Margin

| Seller category | No. of Cattle handled /week | Total purchase price (cost price) N | Total resale price (selling price)-N |
|-----------------|-----------------------------|-------------------------------------|--------------------------------------|
| Retailer        | 118                         | 2,360,000                           | 2,714,000                            |
| Fattener        | 14                          | 462,000                             | 819,000                              |
| Wholesaler      | 28000                       | 98,000,000                          | 145,600,000                          |
| Butcher         | 7                           | 175,000                             | 185,500                              |
| <b>Total</b>    | <b>2939</b>                 | <b>100,997,000</b>                  | <b>149,318,500</b>                   |

Source: Field Survey, 2003

$$\text{Marketing Margin} = \frac{149,318,500 - 100,997,000}{149,318,500} \times 100$$

$$= 47.84\%$$

|                 |   |       |
|-----------------|---|-------|

Source: Field Survey, 2003  
 Fixed costs = N2607,000  
 Note: Cost of rope/head = N150  
 Cost of bamboo stick/head = N150  
 Cost of water & food Container/head = N300

The difference between the total costs of retailers (N3,607,320) and that of the wholesaler (N108,610,000) is due to the very large difference in the number of cattle they handle (sell). The cost per head for wholesalers is N38,789.

29 Retailers are N25,083,22 and fatteners is N46,500 (Table 1, 4 & 5). The high cost per hand for fatteners is due to high cost involved in feeding the animals for the whole fattening period

Table 4: Fixed Costs (capital costs) for cattle fatteners in Maiduguri Cattle Market, 2003

| S/No         | Average purchase price x No of cattle handled/week |
|--------------|--|
| 1            | 33,000 x 2 = 66,000                                |
| 2            | 9,000 x 1 = 9,000                                  |
| 3            | 38,000 x 1 = 38,000                                |
| 4            | 40,000 x 3 = 120,000                               |
| 5            | 50,000 x 1 = 50,000                                |
| 6            | 30,000 x 60 = 180,000                              |

VC = N537,320

TC = 3,607,320

|         | Retailers N | Fatteners N |
|---------|-------------|-------------|
| VC      | 352,820     | 188,700     |
| FC      | 2,607,000   | 463,000     |
| TC      | 2,959,820   | 651,700     |
| TC/head | 25,083,22   | 46,550      |

Note: Labour/week/head = N140  
 Space rent/head for retailers = N50  
 Shed rent/head for fatteners = N600  
 Water, feeding and vaccine for retailers/head/week = N2,800  
 Commission agent/head = N700

#### Market returns

The returns per head of cattle per week is N1,698.96. It is a positive figure which shows that each seller is expected to make an average profit of N1,698.96 per head of cattle sold every week. This suggests that cattle marketing is a profitable business. The positive figure obtained also indicates good performance of the market.

The respective Net Returns for the various categories of sellers are: N16,950 for fatteners, N13,210.71 for wholesalers and N728.57 for butchers. -N2,083.32 for retailers (Table 6). It is expected that at the end of a week the fatterer makes a profit of N16,950/head, wholesaler makes a profit of N13,210.71/head while the butcher makes a profit of N728.57/head. The retailer had a negative NR-N2,083.32 meaning he makes a loss of N2,083.32 on average per week.

This may be because, the retailer handles few cattle, his sales are taken on the daily basis (for the particular sales day), sales may not be everyday and he is faced with extra cost of feeding and keeping animals whether on a sales or no – sales day

**Marketing efficiency**

The marketing efficiency is the maximization of value

added to the costs of marketing services. The value added is the difference between the selling value and initial (purchase) value of cattle

The percentage benefit – cost ratio of 42.29% obtained is a positive figure and close to the average ME (Marketing Efficiency) value of 50%. This suggests the market is performing well (Table 6)

Table 6: Market Returns

| Seller category | Selling price N | No of cattle handled/week N | Fixed cost N | Variable cost N |
|-----------------|-----------------|-----------------------------|--------------|-----------------|
| Retailer        | 23, 000         | 118                         | 2,607, 000   | 352, 820        |
| Fattener        | 58, 500         | 14                          | 463, 000     | 118, 700        |
| Wholesaler      | 52, 000         | 2, 800                      | 98,000,000   | 10,610,000      |
| Butcher         | 26, 500         | 7                           | 175, 500     | 4, 900          |
| Total           | 160, 000        | 2, 939                      | 101,410,320  | 11,156,420      |
| X               | 40, 000         |                             |              |                 |

Source: Field Survey, 2003

Net Returns = 40, 000 x 2, 939 – 112, 566, 740  
 N4,993, 260  
 N1,698 96/head/week  
 NR<sub>r</sub> = N2,083.32/head/week  
 NR<sub>R</sub> = N16, 950.00  
 NR<sub>w</sub> = N13, 210.71  
 NR<sub>b</sub> = N728.57

Marketing efficiency =  $\frac{149, 318, 500 - 100, 997, 000}{112, 566, 740} \times 100$

= 42.29%

Pricing efficiency =  $\frac{100 - (100, 997, 000 - 112, 566, 740)}{48, 921, 500} \times 100$

= 100 – 436

= -336.54

**Price efficiency**

The negative ER obtained (-336.54) shows the market is price inefficient. (Table 6). The inefficiency may be due to;

- i. Location of market in town, being the only main cattle market in Maiduguri
- ii. Market dominated by few firms that conspire to maintain high price;
- iii. Lack of price information to consumers  
 Then prices paid by consumers may not adequately reflect the cost of production and marketing

**SUMMARY AND CONCLUSION**

The total gross marketing margin obtained is 47.84% which is appreciable and shows that marketing service are covered efficiently. The total cost for retailers is N3, 607,320 while that of wholesalers is N180, 610, 000, the large difference in cost is due to the large difference in the number of cattle handled by retailers and wholesalers. The net return is a positive figure; N1, 698.96 per head of cattle received as average profit by each seller. The percentage output – input ratio is 42.29% suggesting that total costs of services have covered all marketing functions efficiently. The efficiency ratio is a negative figure: - 336.54, indicating that the market is price inefficient. The results revealed good market performance with average return on cost of providing marketing services and poor market price performance.
