### ABSTRACT

A checklist of all published spider species from Tanzania is provided. For each species, the localities from which it was recorded are noted and a gazetteer of the geographic coordinates of all but a small minority of these localities is included. The results are discussed in terms of family species richness, the completeness of our knowledge of the spider fauna of this country and the likely biases in family composition.

### INTRODUCTION

Students of spiders are very fortunate in having a complete online catalogue that is continuously updated—the World Spider Catalog (<http://www.wsc.nmbe.ch/>). The catalogue also provides full text of virtually all the relevant systematic literature, allowing ready access to taxonomic accounts for all species. However, researchers interested in the spiders of a particular country face two problems in using the catalogue:

1. For species that have a widespread distribution, the catalogue often lists only the region (*e.g.* “East Africa”) or even the continent (“Africa”) from which it is recorded
2. The catalogue itself provides no information on the actual locations from which a species is recorded.

There is thus a need for more detailed country checklists, particularly those outside the Palaearctic and Nearctic regions where most arachnologists have traditionally been based. In addition to providing an updated list of species from the country concerned, such catalogues can provide details of the actual locations from which each species has been recorded, together with geographical coordinates when these are available.

The history of arachnological exploration of Tanzania falls roughly into three phases: early exploration and the German colonial period between ca. 1850 and 1919, the British colonial period between 1920 and 1960 and the post-colonial period from 1960 to the present. During the first of these periods, collecting in Tanzania was mainly either by early European explorers (such as the German explorer Baron Klaus von der Decken, and the Swedish naturalist Yngve Sjöstedt) or in some cases by missionaries based in Tanzania (such

as Horace Waller whose specimens were described by John Blackwall). These specimens were deposited in major museums in Europe, particularly in Germany, France and Sweden.

During the British colonial period, important contributions to our knowledge of the spiders of Tanzania were made by Lucien Berland (France), Ludovico di Caporiacco (Italy), Albert Tullgren (Sweden) and particularly Roger de Lessert (Switzerland) whose series of papers on the spiders of Mount Kilimanjaro and Mount Meru were well ahead of their time in both the standards of description and illustration. It was during this period that the first European arachnologists started to take an interest in the linyphiid spiders of the mountains of East Africa. The French arachnologist Jaques Denis published papers on this subject in 1950 and 1962. A major contribution was made by the Swedish arachnologist Åke Holm whose expeditions to the mountains of East Africa in 1937-1938 and 1948 led to a series of important papers from 1962 to 1984 and the description of many new linyphiid species from throughout the East African region, including Mount Kilimanjaro, Mount Hanang and Mount Meru.

Following independence in 1960, the pace of discovery of new species in Tanzania increased considerably. The focus on linyphiid spiders then shifted to the much older Eastern-Arc mountains with papers by Nikolaj Scharff and Rudy Jocqué that described many new species from the Uluguru, Usambara and Uzungwa mountains. A particular feature of this period was revisions of families in the Afrotropical region as a whole that have added greatly to our knowledge of the Tanzanian fauna. They include the families Corinnidae (Charles Haddad and Jan Bosselaers), Cyatholipidae (Charles Griswold), Pholcidae (Bernard Huber), Phyxelididae (Charles Griswold) and a long series of generic revisions among the Salticidae (Wanda Wesolowska). Despite this progress, there has been very little systematic collecting in the country in recent years with the notable exceptions of those organised by Nikolaj Scharff and Frontier Tanzania. Unfortunately, many of the larger spider families such as the Araneidae, Lycosidae, Theridiidae and Thomisidae remain largely unrevised in the region and it is among these that major gaps in our knowledge of the Tanzanian fauna remain.

In Africa, only South Africa has an up-to-date checklist of spiders (Dippenaar-Schoeman *et al.*, 2010), arguably the best studied country of the region. The purpose of the present work is to provide a complete checklist of spiders from Tanzania, together with the localities from which they have been recorded and a gazetteer of the coordinates of these localities. It should be noted that the list only includes published records for the country.

## MATERIAL AND METHODS

Initially, a list of all species in each family of spiders that had been recorded from Tanzania was drawn up from the World Spider Catalog (WSC), including all those listed under the general headings of "East Africa" or "Africa". In all cases, the exact locality or localities from which they were recorded was checked in the original publications, here listed in appendix 2. In a very few cases, the only locality data provided is "German East Africa". At the same time, any species apparently omitted from the WSC listing was added to the present catalogue and a few, recorded from neighbouring countries but included in the WSC for Tanzania, have been omitted. The sub-orders Myglaomorphae and Araneomorphae are listed separately but otherwise families, genera and species are listed alphabetically.

Latitude and longitude coordinates for all localities have mainly been taken from the NGA GEONet Names Server (<http://geonames.nga.mil/gns/html/>). Once again, in a minority of

cases, particularly with species described in the 19<sup>th</sup> century, it has proved impossible to find a particular place-name in the NGA database but the species has been included if it was described by a worker who is known to have studied spiders from Tanzania.

## RESULTS AND DISCUSSION

At the time of writing (March 2018), a total of 901 spider species have been recorded from Tanzania. As is the case in most tropical areas, the salticids account for the largest fraction (15%) of the fauna. Other speciose families include Araneidae (7.9%), Linyphiidae (11.4%), Lycosidae (7.8%) and Thomisidae (11.6%). The figure for Linyphiidae is exceptionally high for an afro-tropical country and probably reflects the interests of collectors (mentioned in the introduction) rather than a true proportion of the total fauna. Correspondingly, the figure for Gnaphosidae (3.3%) is exceptionally low and perhaps reflects lack of collecting in the drier savanna regions of the country. For example, in Mkomazi Game Reserve, a dry savanna area of northern Tanzania, gnaphosids accounted for 9.5% of the spider fauna, three times the proportion for the country as a whole (Haddad & Russell-Smith, 2009).

How well recorded is the spider fauna of Tanzania? A comparison of the present checklist with that for South Africa provides some limited insight. The land area of South Africa ( $1.22 \times 10^6 \text{ km}^2$ ) is approximately 1.3 times that of Tanzania ( $0.94 \times 10^6 \text{ km}^2$ ). The most recent checklist for South Africa lists a total of 2156 spider species for that country (Dippenaar-Schoeman *et al.*, 2010). Simply on an area basis, an expected total for Tanzania would be 1660 species, almost double the actual figure. Even allowing for the much more intensive recording that has occurred in South Africa (particularly over the past 30 years) and the considerable differences in the range of biomes and habitats in the two countries, this suggests that Tanzania remains seriously under-recorded. Several other pieces of evidence support this conclusion. Firstly, the catalogue of spiders from Tanzania in the collections of the Royal Museum for Central Africa, Tervuren includes 75 reliably identified species not included in this listing (Rudy Jocqué, pers. comm.). It is highly likely that other major collections from Tanzania also harbour more species not included here. Soerensen *et al.* (2002) found 170 morpho-species in 5 hectares of montane rainforest at 1800 meters above sea level in Udzungwa Mountains, of which 80% were new to science. Another, more recent study by Malubres-Olarte *et al.* (2018) found 631 morpho-species in 3.75 hectares of the same mountain range, of which 85% were new to science. The survey of spiders of the Mkomazi Game Reserve mentioned above recorded a total of 493 spider morpho-species, suggesting that the poorly recorded semi-arid areas of lowland Tanzania harbour many more spider species than had hitherto been realised.

## ACKNOWLEDGMENTS

I am extremely grateful to Rudy Jocqué for providing a list of named Tanzanian spiders in The Royal Museum for Central Africa, Tervuren and to Ansie Dippenaar for providing a draft list of spider species from Tanzania. My particular thanks go also to Nikolaj Scharff for reading an early draft of this paper, pointing out missing species and useful discussions on presentation.
