

# The Ghosts of Acetylcholine : Structure-activity relationships of Muscle Relaxants

**Dr JJF Handley**

*University of Cape Town*

---

This presentation attempts to see the structure of acetylcholine in all muscle relaxants that are clinically useful.

It begins with the structure of acetylcholine itself , then progresses to suxamethonium and incorporates all nondepolarising agents.

The talk is not too academic but does use lots of chemical formulae and requires a slightly slower presentation and a little concentration.

The aim is to approach the subject a little differently and leave the audience with a fresh perspective.
