<sup>a</sup> Relative strain energy, measured relative to the lowest energy species in each reaction.

**Figure S1** Spectral changes accompanying the reaction of 1,2,4-triazole with ACCbs-Pr in aqueous solution at 25 °C.  $\lambda_{\max}$  of the product, (Tz)(CN)Cbs-Pr occurs at 360, 516 and 548 nm. Well-defined isobestic points occur at 355.5, 395 and 511 nm.

**Figure S2** A log-log plot of ACCbs-Pr (in aqueous solution, pH = 9.0, I = 0.1 mol dm<sup>-3</sup>, 25 °C) with Tz. The slope  $n = 1.04 \pm 0.03$  shows that a single Tz ligand is complexed, i.e. H<sub>2</sub>O, but not CN<sup>-</sup>, is displaced from Co(III).

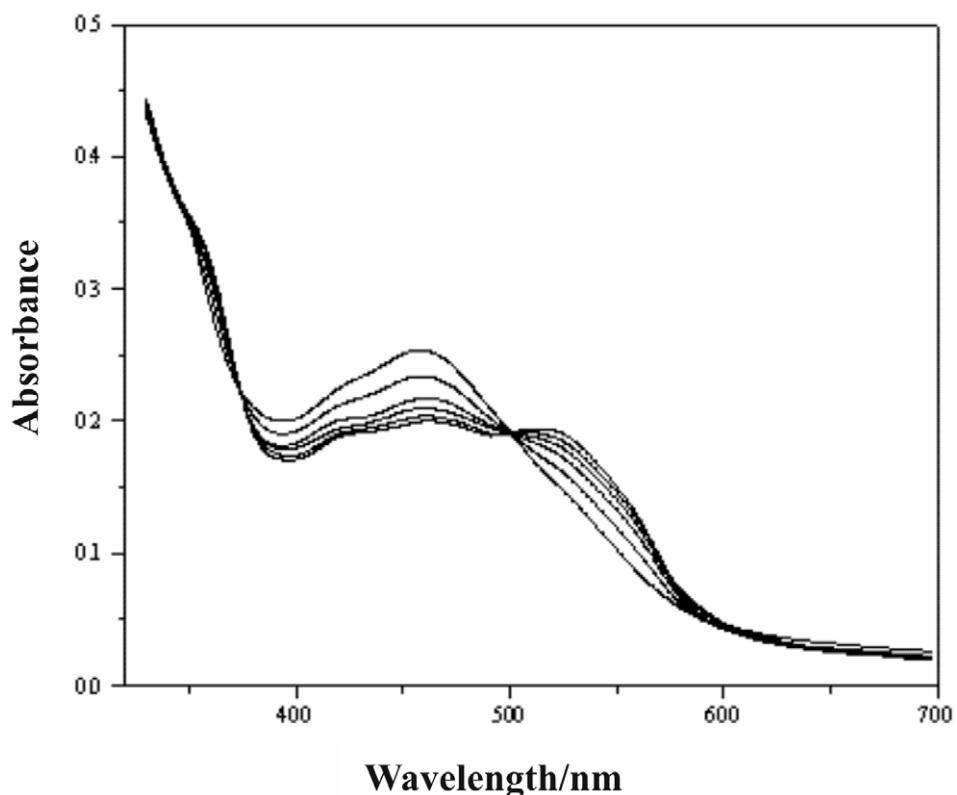

Figure S3 Spectral changes accompanying the spectrophotometric titration of SCBs-Pr in ethyl acetate with ImH at 25 °C.

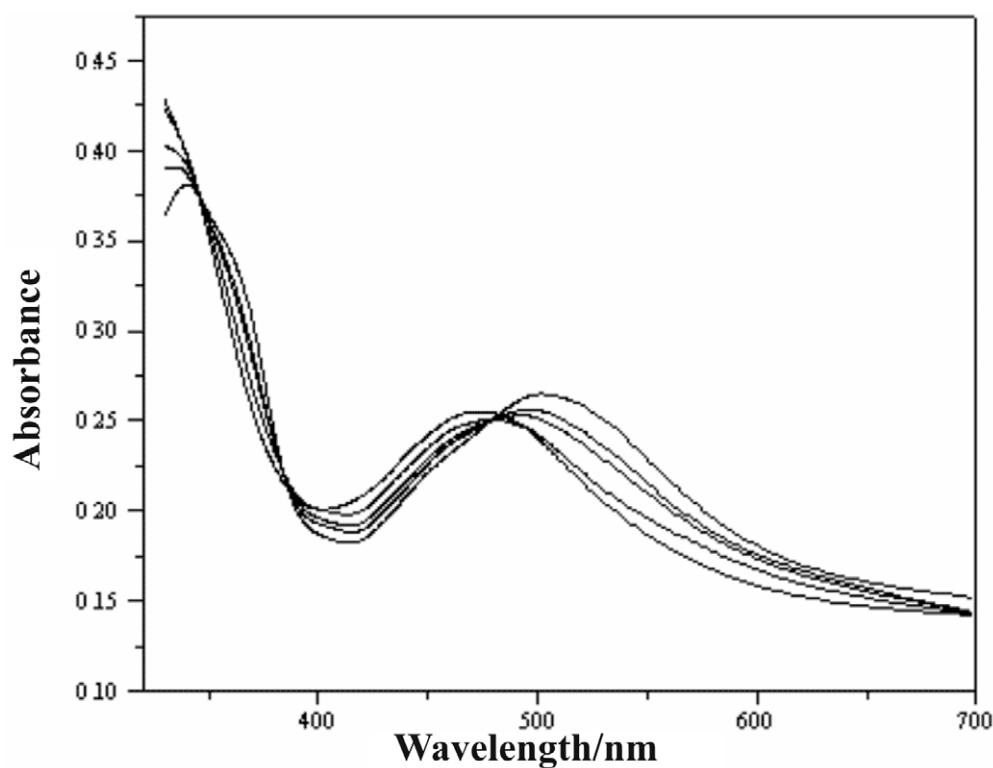

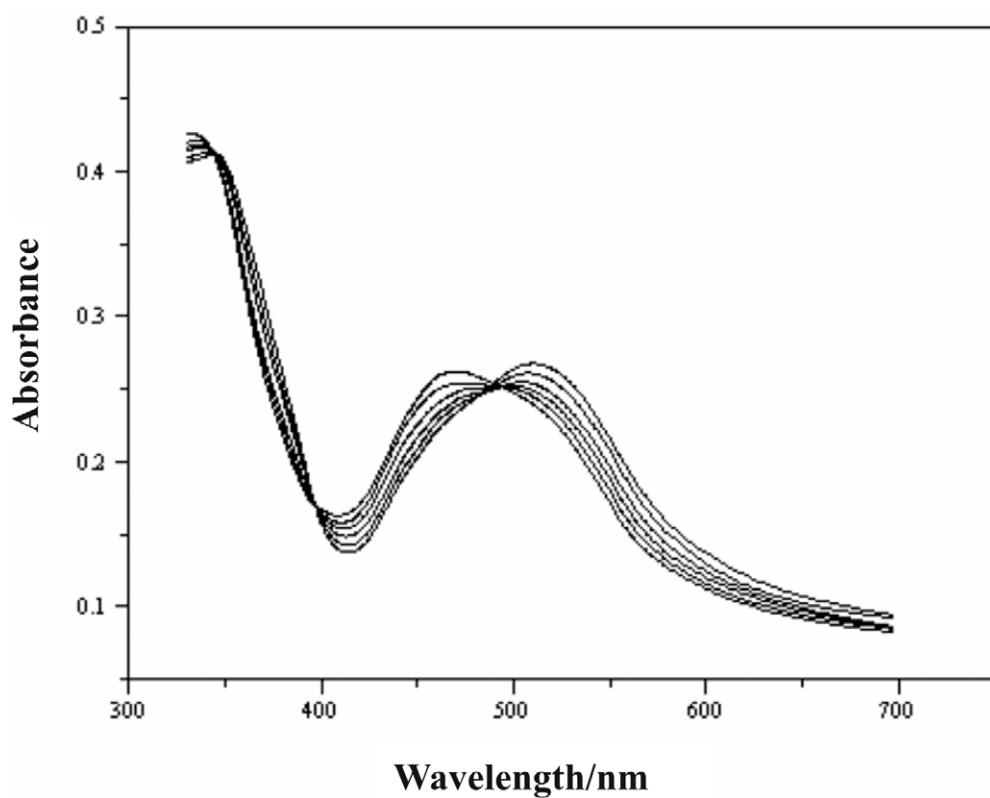

Figure S4 Spectrophotometric titration of MeCbs-Pr in  $\text{H}_2\text{O}$  with Pz at 25 °C.

**Figure S5** Spectrophotometric titration of EtCbs-Pr in H<sub>2</sub>O with ImH at 25 °C.
